

Side View of Tower

Marley Cooling Tower Top “L Bracket”

L Bracket to run across the top width of the opening (immediately above the fill) and fasten to the outer flange of the tower left & right. The L bracket will need to be notched out at each end to the width of the outer flange

The short dimension of the L bracket should be 2” and facing downward to accommodate fastening of the filter across the top.

The long part of the L bracket is to extend back toward the center of the tower to block-off airflow that would otherwise get into the tower between the back of the filter and the recessed top flange.

The L bracket will need to also be notched at the location of the cross supports so bracket will slide to the back portion of the recessed flange area.
